Question

Q1 General comments on the draft Issues Paper

Answer

GFIA appreciates the opportunity to comment on the issues paper, the effort of supervisors and the over-all balance provided in the paper. GFIA especially appreciates the openness to stakeholders exhibited by the IAIS' Market Conduct Working Group.

Here are some general comments for consideration: • The paper should more explicitly recognise the benefits of insurers' use of big data analytics (BDA). • Many of the possible risks discussed in the paper, such as biases resulting in discrimination and reduction of access to insurance, lack evidence and may be mitigated by the use of BDA, in any event. • Algorithms are able to take in more information, which de-emphasises the reliance on any one data point and should improve accuracy. • The paper should explore the benefits of more personalised retail insurance products, potential risk mitigation and targeted marketing. • Some of the supervisory concerns mentioned in the paper, such as industry consolidation, non-compulsory insurance products and the issues surrounding genetic data, are not BDA specific concerns. • The supervisory concerns mentioned in the paper can be, and are being, addressed under current supervisory standards. • The paper should emphasise that the best way to address any residual supervisory concerns is through a dialogue between supervisors and the companies proposing the innovations. • More emphasis should be placed on the importance of supervisors holding start-ups to the same standards as traditional insurance companies.

Q2 General comments on the Executive Summary

Answer

It would be beneficial to frame the use of BDA as a natural extension of the practices and tools that have traditionally been used in insurance. Insurers are moving from actuaries using traditional data and simple techniques to actuaries using additional data and more complex techniques. The constant through the change is the presence of the actuary to ensure the outcomes are appropriate as governed currently by regulation and actuarial professional standards. This framing represents the reality that this is not rogue actors making unfounded decisions with no guidance, but rather a guided evolution of techniques in keeping with other insurance innovations of the past.

Q3 Comment on Paragraph 1

Answer

Q4 Comment on Paragraph 2

Answer	
	Q5 Comment on Paragraph 3
Answer	
	Q6 Comment on Paragraph 4
Answer	
	Q7 Comment on Paragraph 5
Answer	
	Q8 Comment on Paragraph 6
Answer	Affordability is an issue insurance markets face. However, risk-based granular pricing signals the need for greater resilience/risk-reduction responses where high premiums reflect the nature of a given risk. BDA, which is a tool that more accurately assesses risk than traditional underwriting and rating models, sends important financial signals to people and businesses that encourage them to change their behavior and invest in measures to improve their risk profile. Supervisors limiting how insurers apply BDA to keep insurance affordable for high-risk customers in the short-term could lead to long-term adverse customer outcomes, such as encouraging development in high-risk flood and earthquake areas.

Answer	
	Q18 Comment on Paragraph 14
Answer	
	Q19 Comment on Paragraph 15
Answer	
	Q20 Comment on Paragraph 16
Answer	The accessibility and affordability concerns associated with greater individualisation in underwriting and rating from BDA are similar to the concerns associated with telematics devices, such as usage-based insurance, and to the concerns expressed for decades as insurers' traditional rating algorithms became more sophisticated. Insurers are used to managing these concerns. Greater opportunities to segment the market also provide opportunities for new or incumbent insurers to specialise in certain market segments. GFIA also notes that most insurance lines offer many ways to tailor insurance coverage to make it more affordable, the most obvious being different limits above any statutory minimums and deductibles.
	Q21 Comment on Paragraph 17
Answer	For decades, insurers have been working to refine their underwriting and rating practices to offer consumers insurance at prices that reflect their unique risk profiles. BDA is just another innovation to help insurers achieve that objective. Other innovations before it are actuarial science, statistical modeling and telematics. While the previous innovations brought significant change to the market, consumers always benefited from more product choice and more pricing options. Very few people became uninsurable. Although there are indeed possible risks to the use of BDA, GFIA does not see any reason for the IAIS to assume at this time that the use of new techniques will cause detriment to consumers.
	Q22 Comment on Paragraph 18
Answer	Jurisdictions have usually defined "fairness", which may differ based on their own balancing of social and political norms. Accordingly, GFIA urges the IAIS not to adopt or reference any particular standard out of its total legal context. For example, the concept of "disparate impact" in the U.S. is advocated by some, but opposed by many and has not been legislated by the states. In addition, linking to a single U.S. regulator's action on a highly controversial matter, when it is only one of 50 plus regulators in the U.S., would give a false impression of the true state of the law and regulatory standards in the over-all U.S.
	Q23 Comment on Paragraph 19
Answer	The fact that privacy laws fall out of the remit of insurance supervisors does not mean that supervisors should not be aware of the impact of these laws on the use of technology and, more specifically, BDA tools in insurance. Supervisors should help other policymakers understand the unique and appropriate use of data by insurers and so help to draft constructive laws and apply them to support competition and beneficial innovation in insurance.

Answer	
	Q28 General comments on Section 2.1: Sources and collection of data
Answer	
	Q29 Comment on Paragraph 22
Answer	Supervision of various data elements differs among jurisdictions with regard to the data elements and for what purposes they are used. For example, it may be appropriate to use a data element for pricing but not for the decision to provide cover, such as age of the auto driver.
	Q30 Comment on Paragraph 23
Answer	
	Q31 Comment on Paragraph 24
Answer	Not enough attention is provided to the importance and prevalence of upfront notices and permissions to access data already provided by insurers. Many countries have privacy laws that address access to data as well as dedicated regulators for enforcing those laws, including consent provisions. People are used to using phones with GPS technology and telematics devices so they understand the nature of the data being generated and potentially shared. GFIA does urge, however, that insurance regulators actively engage in the drafting and implementation of privacy laws to assure that appropriate and efficient access and use by insurers is permitted for legally permissible purposes.
	Q32 Comment on Paragraph 25
Answer	
	Q33 Comment on Paragraph 26
Answer	
	Q34 Comment on Paragraph 27
	5 ,
Answer	
	Q35 Comment on Paragraph 28
Answer	Yes, data collected from a telematics device falls within an insurance context. While information posted on someone's social media account is not for an insurance context, people understand that by posting this information on certain social media sites, the information becomes available to other parties. However, GFIA is not aware of widespread use of social media information for pricing and underwriting. The European Insurance and Occupational Pensions Authority made a similar finding (page 27).
	Q36 General comments on Section 2.2: Processing of data
Answer	

	Q37 Comment on Paragraph 29
Answer	
	Q38 Comment on Paragraph 30
Answer	
	Occordant Description 24
	Q39 Comment on Paragraph 31
Answer	
	Q40 Comment on Paragraph 32
Answer	
	Q41 Comment on Paragraph 33
Answer	Insurers have been improving their data and models so that their underwriting and rating practices, as accurately as possible, reflect a customer's risk profile. BDA is one of the latest innovations in modeling.
	Q42 Comment on Paragraph 34
Answer	Explaining algorithms to supervisors and consumers is not an issue unique to BDA. Insurers have been managing it for decades. Disclosure to supervisors should likely be more detailed than to consumers. Preferably, supervisors should structure and encourage upfront dialogue with companies so as to make this disclosure as efficient and effective as needed. Disclosure to consumers will need to be more general to make the information more useful to them and to protect insurers' intellectual property and encourage investment in beneficial innovation. GFIA also notes that supervisors usually have a full tool kit of measures to require disclosures to them and to enforce the relevant standards.
	Q43 Comment on Paragraph 35
Answer	Predicting future losses to determine insurance prices is challenging with the constant potential for error. This issue is not unique to BDA. It presents itself in traditional rating practices as well as telematics. Paragraphs 35-37 also seem to be entirely speculative. Real world examples would be useful to readers.
	Q44 Comment on Paragraph 36
Answer	
	Q45 Comment on Paragraph 37
Answer	GFIA disagrees with the use of the UK example under paragraph 37, which suggests unlawful discrimination against certain customers. It is unlawful to price insurance based on ethnicity in the United Kingdom, and insurers will always act within the law. The example in question from a BBC report is based on flawed research, which produced misleading results caused by a variety of different factors, which are not taken into account in the article. For example, quote engines often put up prices automatically as an anti-fraud measure when people adjust details, as it is designed to identify where inaccurate details are entered or implausibly changed – in this example, changing the names, address or IP address in succession. After the article's publication, the insurer in question issued an explicit denial that it uses name as a factor in its pricing and, as this would be unlawful, it is telling that there has been no follow-up from the UK Equality and Human Rights Commission.

	Q62 Comment on Paragraph 50
	Que de la commentant al la graphica
Answer	It should be encouraged for insurers to become more effective partners with their
	customers in understanding their risk and mitigating it. BDA provides the opportunity to do
	so, including providing tailored advice, products and services to millions of personal
	insureds, for example to prevent flooding, which also has larger social benefits.
	Q63 Comment on Paragraph 51
	Que de la
Answer	Paragraphs 51-53. Product differentiation is an opportunity for intermediaries and direct
	insurers to engage with their customer and provide more information on product offerings.
	These opportunities do not exist as much when products are standardised, which is why, in
	many jurisdictions, there is limited understanding of the coverage provided by insurance. Through intermediaries, product/price comparison websites or directly from an insurer,
	consumers can easily get the information that they need to find coverage options and
	make an informed purchase.

Answer	
	Q76 Comment on Paragraph 60
Answer	
	Q77 Comment on Paragraph 61
Answer	Again, lower risk consumers paying less for insurance and higher risk consumers paying more has been a product of insurers' ongoing improvements in underwriting and rating for decades. Insurance also sends an important financial signal to higher-risk customers to change their behavior. These developments are positive.
	Q78 Comment on Paragraph 62
Answer	Contrary to this paragraph, the real world experience is that more granular pricing has actually made insurance more available and more affordable for most consumers. However, there are always a very few that are uninsurable. In those cases, governments must decide how to treat them but that should not interfere with more granular risk-based pricing.
	Q79 Comment on Paragraph 63
Answer	
	Q80 General comments on Section 3.2.2: Price optimisation
Answer	
	Q81 Comment on Paragraph 64
Answer	Paragraphs 64-68. Price optimisation has effectively ended in the U.S. with the support of the industry. Supervisors have made clear that pricing must reflect risk, a requirement that both supervisors and insurers fully agree with. Notably, in November 2018, the European Union submitted a report to the OECD, Personalised Pricing in the Digital Era – Note by the European Union, which concluded that there is "no personalised pricing in the EU on any significant scale" (page 7).

Allswei	
	Q89 Comment on Paragraph 71
Answer	The risk that consumers who do not want to share certain data or who do not have the means to share certain data could be uninsurable is speculative. Improved underwriting
	and rating sophistication has a history of enhancing the availability of affordable insurance.
	OOO Comment on Deregraph 70
	Q90 Comment on Paragraph 72
Answer	Coverage for low risk vulnerable populations should be a concern shared by supervisors
	and the industry. However, that issue should be distinguished from high-risk populations
	whether vulnerable or not. These may in fact be uninsurable for entirely legitimate reasons. Government then should decide how they are treated, but this should not undermine
	risk-based pricing, which is fundamental to the solvency and competitiveness of insurers.
	Q91 Comment on Paragraph 73
Answer	Although controversial in the insurance underwriting process, in some GFIA jurisdictions,
	genetic data has value for health and wellness initiatives. In such jurisdictions, genetic data can also help reduce the time and invasiveness of life insurance underwriting. It should be
	noted that some jurisdictions that restrict genetic data use for insurance purposes do so
	because of societal consensus. Insurers in those jurisdictions were part of those discussions and decisions.

Answer	
	Q101 Comment on Paragraph 80
Answer	
	Q102 Comment on Paragraph 81
Answer	Paragraphs 81-82. It should be emphasised that companies should not over-rely on settlement models and should always have the capability to review individual circumstances. In addition, most jurisdictions have comprehensive prudential and market conduct regulations that place governance requirements on insurers to mitigate against the risk of under-reserving or improperly handling claims. Insurers also have enterprise risk management programs and actuarial approvals. They also tend not to rely on a single model for making underwriting and claims decisions.
	Q103 Comment on Paragraph 82
Answer	
	Q104 Comment on Paragraph 83
Answer	Insurers are contractually required to indemnify the customer for his/her actual loss. There are also laws and regulations in many jurisdictions that require fair treatment of claimants. Accordingly, GFIA knows of no evidence to support this suspicion. This paragraph implies that claims optimisation of this nature is practiced and is a real risk facing consumers. Yet the statement "It is currently unclear how widespread that practice is" indicates that this practice could be nothing more than the actions of a rogue insurer or a simple fear. The IAIS should reconsider including this paragraph in the issues paper because it can hurt the insurance industry's reputation and because there is no evidence to support claims optimisation of this nature being a market practice.

	Q112 Comment on Paragraph 89
	Q112 Comment on Faragraph 69
A	
Answer	As mentioned, most jurisdictions already have comprehensive data use and privacy laws.
	Similarly, most insurance supervisors have comprehensive regulations governing insurer
	underwriting and claims practices that would apply to BDA. To avoid duplicative or
	contradictory regulation, GFIA advises that prior to the IAIS releasing its supervisory
	guidance on BDA, it document the main laws and regulations across the world. This way,
	any subsequent IAIS guidance on BDA would complement the existing laws and regulations which GFIA views as robust.
	regulations which GFIA views as lobust.
	The IAIS should also emphasise that upfront and ongoing dialogue between supervisors
	and companies is the best way to assure the benefits of innovation and provide supervisors
	with the confidence they need in the application of BDA. Finally, it should be noted that
	disclosure mandates on insurers should differ depending on whether the recipient is the
	supervisor or the recipient is the consumer.

Answer	
	Q122 Comment on Paragraph 97
Answer	Paragraphs 97-100. GFIA takes the view that existing governance standards are sufficient to assure good governance of the use of BDA. Premature intervention could hamper innovation and impair the effectiveness of the insurance market and could quickly become unfit for purpose due to technological advances and market developments. Regulators and supervisors should ensure that existing rules are fully implemented and enforced. Supervisors should continue their efforts to monitor the impact of the use of big data on markets and consumers, and work together with stakeholders, including the insurance industry, to support innovation that benefits consumers.
	To the extent there are new concerns, supervisors should engage in ongoing dialogue between supervisors and companies as the best approach, not new governance standards or more intrusive supervision.
